

Institut Mines-Télécom

SUPERVISION DE SÉCURITÉ - SECURITY INFORMATION AND INCIDENT MANAGEMENT

HERVÉ DEBAR
TÉLÉCOM SUDPARIS

Information systems are targets of attacks

Resources
Information

Full protection is impossible or impractical

Limits use and scalability
Cost
Management

Detecting attacks as early as possible is the next best option

And deploying appropriate remediation

James P. Anderson Co.

COMPUTER SECURITY THREAT
 MONITORING AND SURVEILLANCE

CONTRACT 79F296400

February 26, 1980

Revised:
 April 15, 1980

TABLE OF CONTENTS

	<u>Page</u>
1.1 Introduction	1
1.2 Background	1
1.3 Summary	3
2. Threats	4
2.1 Scope	4
2.2 Gaining Access to the System - External Penetration	6
2.3 Internal Penetration	11
2.3.1 The Masquerader	11
2.3.2 Legitimate User	12
2.3.3 Clandestine User	14
2.3.4 Clandestine User Countermeasures	14
3. Characterization of Computer Use	17
3.1 Introduction	17
3.2 The Unit of Computer Work - The Job or Session	17
3.3 Time Parameters	18
3.4 Dataset and Program Usage	23
3.5 Monitoring Giles and Devices	24
3.6 Group Statistics	24
4. Structure of a Surveillance System	26
4.1 Introduction	26
4.1.1 Monitoring of Users	26
4.1.2 Sorting Audit Records	26
4.1.3 Session Record Builder	28
4.1.4 Surveillance Program	28
4.2 Monitoring Files	32
5. Adapting to SMF Data	38
5.1 Relevant SMF Records	38
5.2 Other Surveillance Tools	41
5.3 Summary	43
6. Development Plans	46
6.1 Introduction	46
6.2 Surveillance Subsystem Functional Description	46
6.3 Tasks	48
6.4 Trace Subsystem Functional Description	50
6.5 Tasks	51
6.6 Integration of Subsystems	53

Intrusion detection concepts (1985)

- Misuse detection
- Anomaly detection

Intrusion Detection Working Group @IETF

- December 1998: first meeting, Washington DC

Intrusion detection prototypes (1990)

- IDES & NIDES
- Wisdom & Sense
- Haystack
- ISS RealSecure & Snort (1996)

Security Information and Event Management (SIEM)

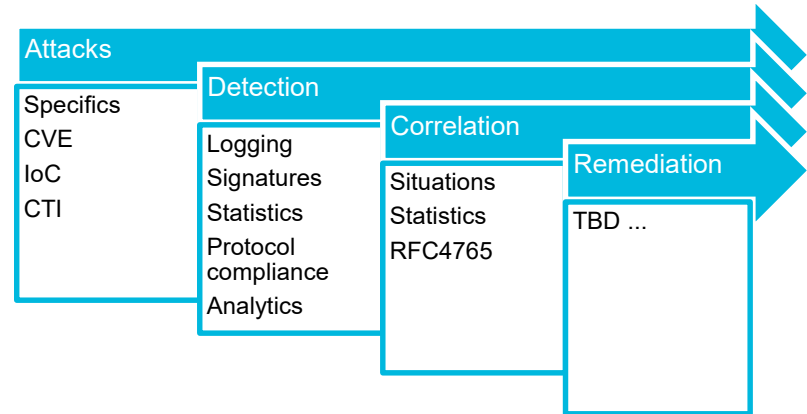

- Tivoli Rosk Manager
- RFC4765
- QRadar

Cyber-Threat Intelligence (CTI)

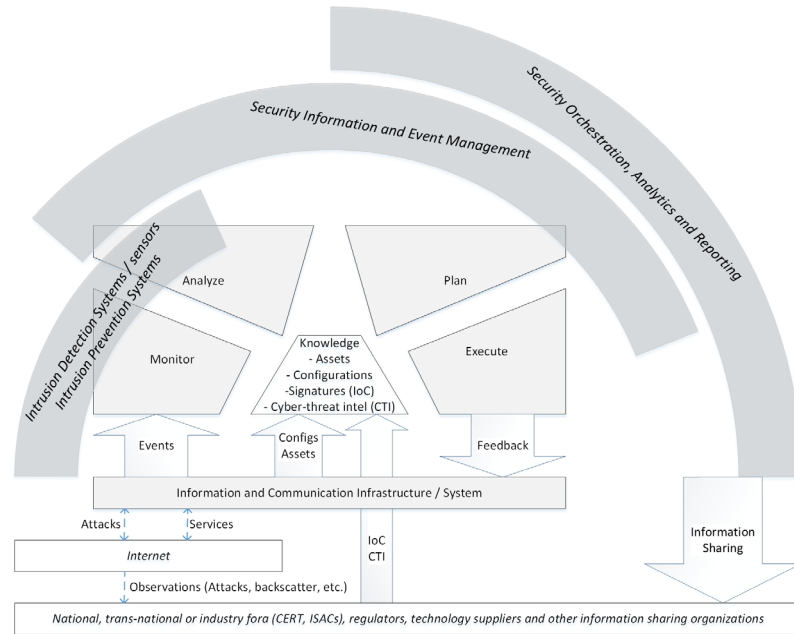

Security Orchestration, Analytics and Reporting (SOAR)

- CTI
- Remediation

Security Operations and Incident Management

<https://csrc.nist.gov/publications/history/>

Supervision is about information management

- Logs and others
- Processing
- Decision
- Feedback & control

Many actors with conflicting interests

Intrusion detection systems (IDS)

Monitor systems and networks to create or collect execution traces
Analyse them (in real time) to detect issues and provide alerts

Security Information and Event Management (SIEM) platforms

Analyse events and alerts to triage them according to their impact; identify incidents
Plan: select potential responses to incidents
Execute: push recommendations to system and network analysts

Security Orchestration, Analytics and Reporting (SOAR) platforms

Analyse further the collected information (events, alerts, incidents)
Plan: assess response plans according to business impact
Execute: partially automate deployment of response plans

Segmentation of the network in zones

Sensitivity

Quantity of exchanges

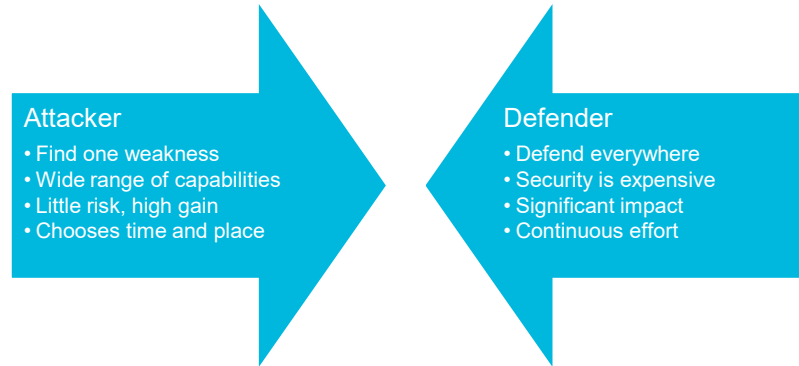

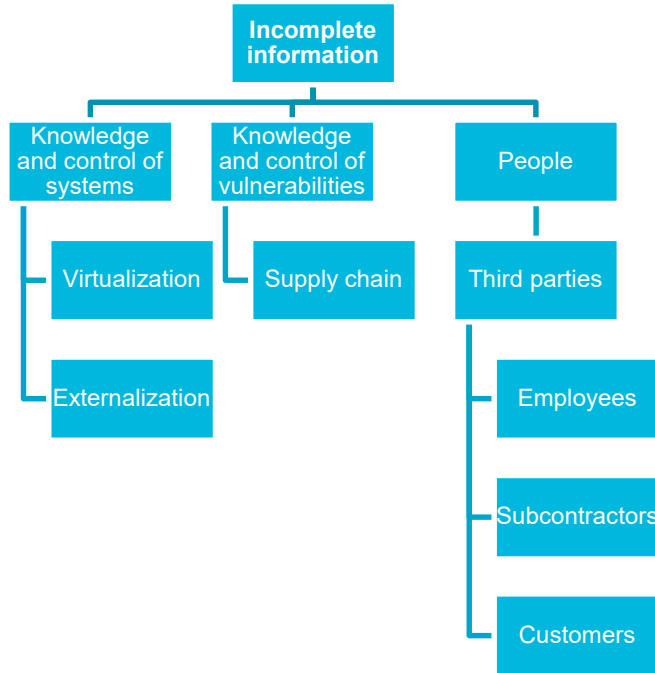

Sensors and log feeds deployed to collect traces and detect malicious behaviour

Private network to gather event and alert feeds

SIEM platform to manage events, alerts and incidents

Technical support of Security Operating Centre (SOC)

Any contribution must include a relevant threat model and demonstrate progress w.r.t the threat model.

INTRUSION DETECTION AND PREVENTION SYSTEMS FROM EVENTS AND TRACES TO ALERTS

Process traces of execution

Representative of the activity of a « system »

Enable differentiation between normal and malicious activity

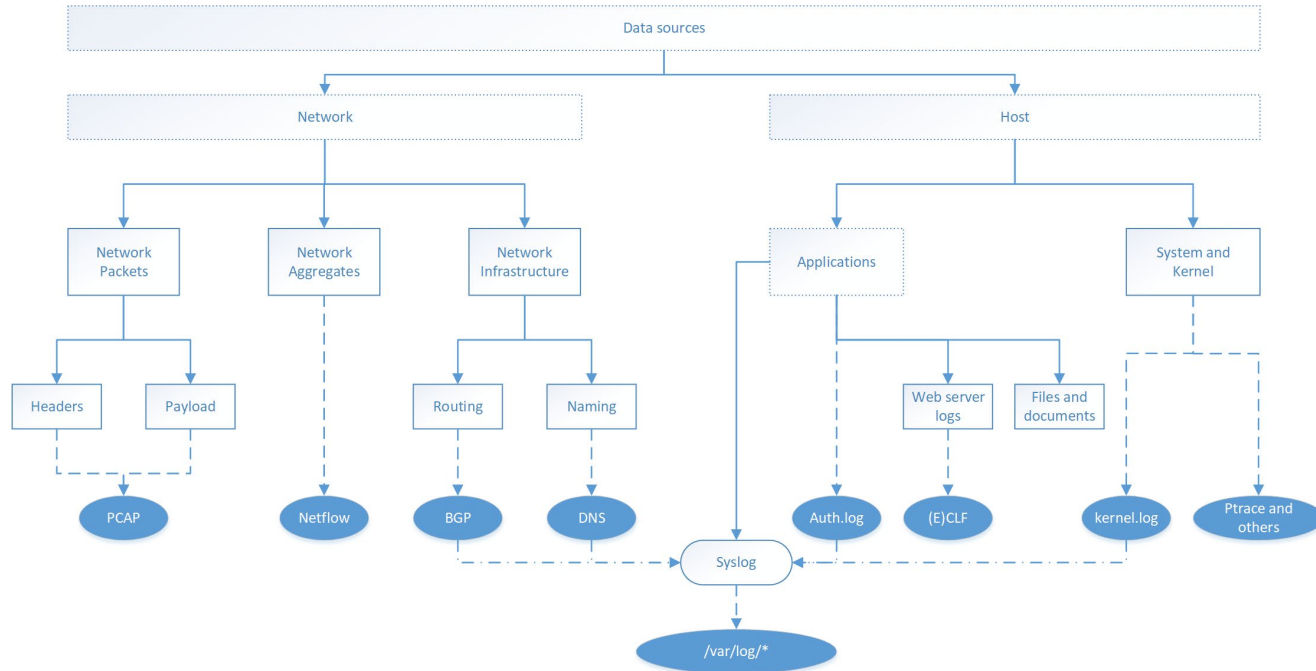

Separate appropriate from malicious activity

Rationale for suspicion (what)

« Evidence » if possible (why)

Levels of suspicion frequently used

Raise alert: symptom of misbehaviour

Network packets

Carriers of attacks (e.g. malware in payload)

Symptoms of compromise (e.g. connection to Command&Control infrastructure)

Network aggregates

Deviations in traffic patterns (ports, conversations, volume)

Network infrastructure

Use of the Domain Name System (DNS) for command and control

Manipulation of the routing infrastructure to reroute traffic or hide malicious activity

Traces provided by applications related to their runtime behaviour

Web servers in particular

Representing specific activity

Usually collected through system mechanisms

Unix: /var/log

Syslog

Also includes documents

Complicated parsing

Underestimated research issue

Trustworthiness

Performance

Kernel logs

Intercepted very low in the execution path (assembly language)
Focusing on malware detection

Interest in the Android ecosystem

Understand interactions between apps and supporting libraries
Call-back mechanism obscures malicious activities

Hardware-based capture ?

Generic logging infrastructure

Entry composed of

Timestamp

Hostname

Process

Priority

PID

Message

Extremely useful both for event and alert management

But need stronger semantic for « Message »

Normalization, canonization and labelling

Syntax of the data
Semantic of the data

Transformation to meet needs of detection algorithms

E.g. transform text data in numerical form

Encrypted data flows

Access limited to the outer envelope of the data

Voluminous data flows

Limits transportation and storage

Personally Identifiable Information (PII)

Conflict between technical data and PII: network addresses

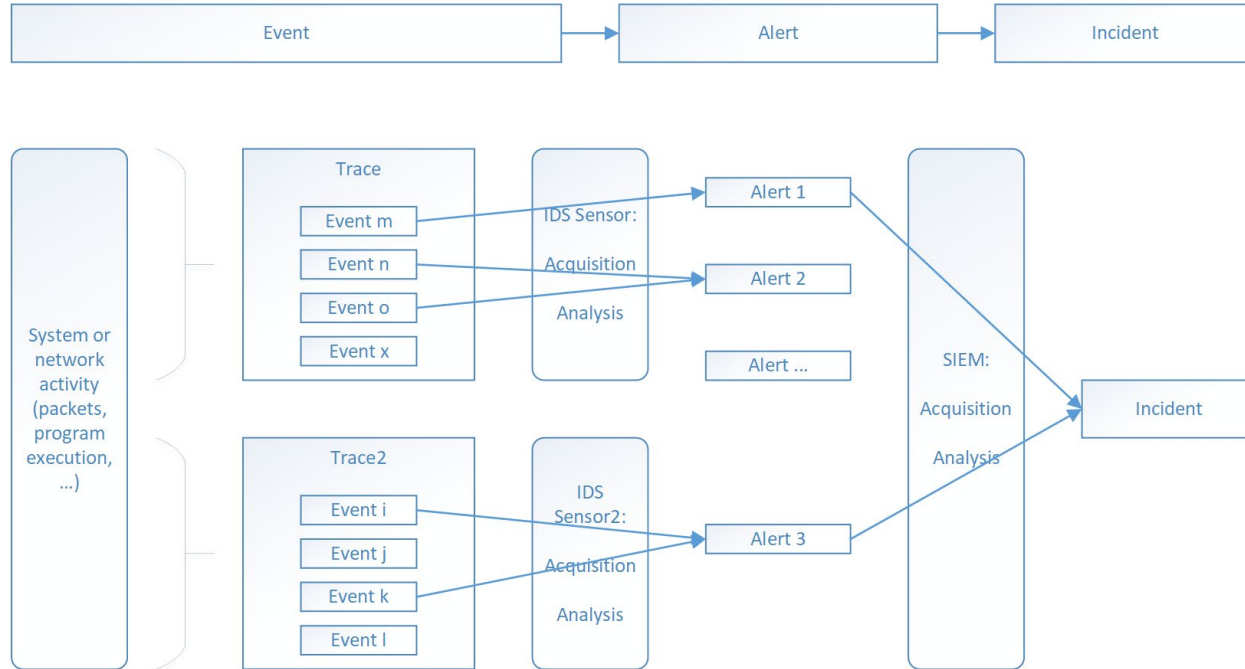

Objective : generate incidents from alerts and events

Intrusion detection sensors

- Deployed in the field
- Collect event information
- Produce alerts

Analysis techniques

- Misuse detection
- Anomaly detection

Gather knowledge about attack processes

Model occurrence of attack in traces

Signatures (indicators of compromise)

Detect presence of such occurrence in current trace

Advantage

Alerts are qualified by a root cause

Drawback

Management of attack process knowledge
Expertise and time

Gather knowledge about process behaviour

Expected behaviour (e.g. standards and policies)

Behaviour learned through observation

▶ *Machine learning*

Detect presence of such occurrence in current trace

Define deviation from the norm

Advantages

Unknown attack processes are detected by their side effects

Drawbacks

Assumption of detectable side effect

Diagnosis of alert impact

Selection of behavioural model (many possibilities)

Attack-free training (ground truth)

Understand and specify the detection target

Which attacks (or attack categories), how reliable

Classic evaluation metrics

Significance of false positives and false negatives improvements
Ability to compare one's work to the state of the art

Base-rate fallacy

Magnitude of difference between the volume of attacks and the volume of normal activity in traces

Trustworthy and efficient logging

Test, evaluation and validation

Methodologies and metrics

▶ Including relevance “in the field”

Libraries, tools, ... for practical undertaking of evaluation and validation

SECURITY INFORMATION AND EVENT MANAGEMENT

« THE BACK-END »

Blue part

Personnel component essential

Managed service model

Definition of

Schema: structure and semantic of messages

Encoding: transformation of message in bit string

Transport protocol

Format	Owner	Transport	Encoding	Structure	Number of attributes
CEF	HP/Arcsight	Syslog	Key/value	Flat	117
LEEF	IBM/QRadar	Syslog	Key/value	Flat	50
CIM	DMTF	Any	(XML)	UML	58
CADF	The Open Group (NetIQ)	Any	(JSON)	Classes	48
CEE	MITRE	(Syslog)	JSON, XML	Structured	56
IDMEF	IETF	IDXP	XML	UML	166

Examples

Hiet, G., Debar, H., Ménouar, S., & Houdebine, V. (2015, November). Etude comparative des formats d'alertes. In C&ESAR (Computer & Electronics Security Applications Rendez-vous) 2015 (pp. 125-148).

Objectives

- Reduce the number of alerts to process
- Automatically identify false positives
- Group alerts into incidents
- Propose remediations

Correlations techniques

- Alerts sharing the same characteristics (addresses, ports, etc.)
- Alerts associated with contextual information
 - ▶ Environment
 - ▶ Cyber-Threat Intelligence
 - ▶ Information exchange

Obtain situational awareness

Appropriately assess risk of events

Impact on IT infrastructure

Impact on organization

Applicability to new architectures and attack patterns (loosely controlled systems, IoT, ...)

Long-term diagnosis

Evaluate past decisions regarding incidents in the light of new information

Posture analysis (continuous risk assessment)

Efficiency analysis (detection coverage, decision capability)

Decision support system

Reporting and attribution (and their consequences on detection and correlation)

Test, evaluation and validation

MITIGATIONS AND COUNTERMEASURES

**OBJECTIVE: BLOCK
ATTACKS BEFORE
SIGNIFICANT DAMAGE**

Intrusion Prevention Systems

Immediately apply remediation to the data stream upon detection

Block or terminate connections at the network level

Change content (a.k.a. virtual patching) in network packets or instruction sequences

Traffic management for denial of service attacks

Dedicated tunnels

Anycast

Sort of « out of tune » in recent years

Impact and risk assessment

Understand the business risk associated with the incident

Understand potential collateral damage of reacting / doing nothing

Relevant normalized knowledge sources

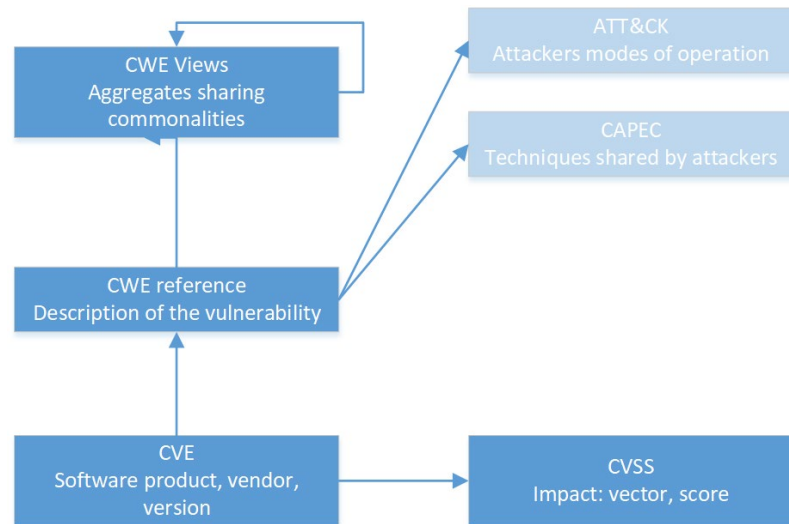

Common vulnerabilities and exposures (CVE)
 Common vulnerability scoring system (CVSS)
 Common Weakness Enumeration (CWE)
 Common Attack Pattern Enumeration and Classification (CAPEC)
 Adversarial Tactics, Techniques & Common Knowledge (ATT&CK)

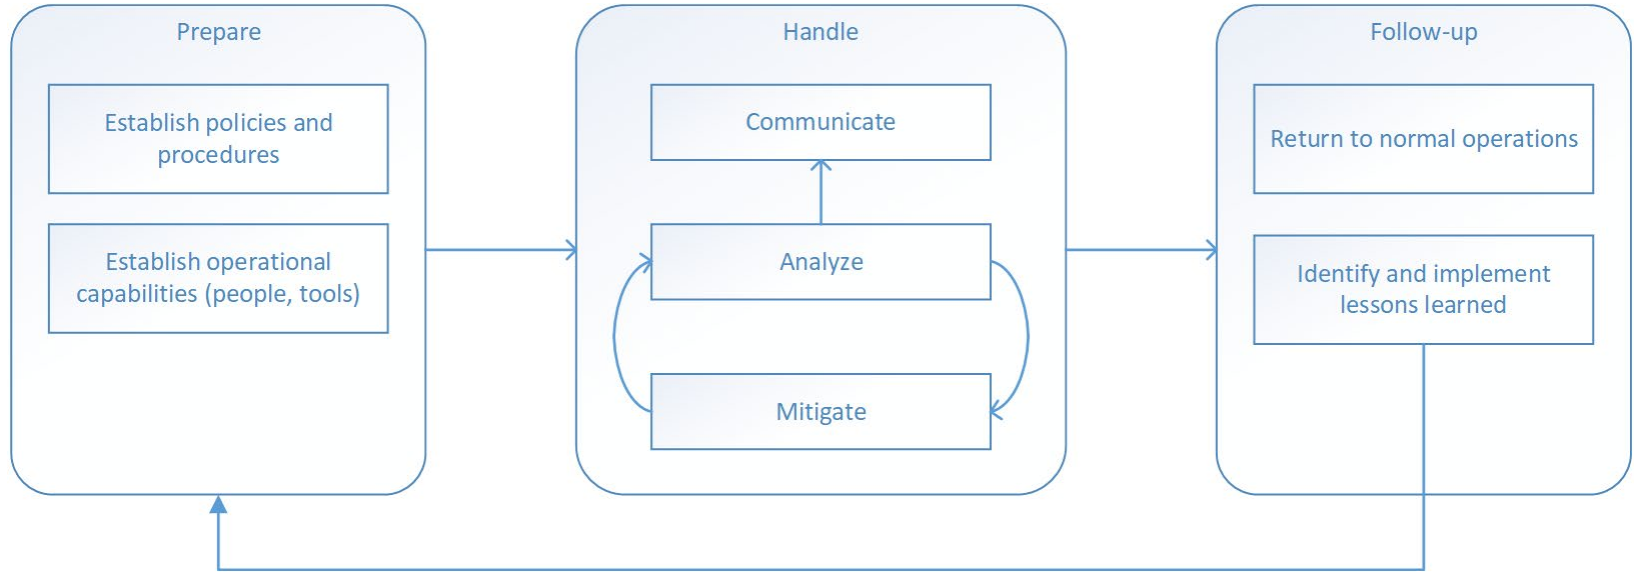

...

Honeypots and honeynets

Cyber-Threat Intelligence

Understand malicious activity in the Internet
 Identify relevant threats and deploy detection/protection means
 Share compromise information
 ► Information Sharing and Analysis Centres

Provide relevant and actionable decisions for mitigating and removing threats

Effectiveness of threat removal

Cost/gain analysis

Deploy appropriate counter-measures in complex distributed systems

Including legal challenges (e.g. device identification and ownership)

Feasibility of responding in cyber-physical systems

Test, evaluation and validation

Security Operations and Incident Management increasingly relevant

Wide range of connected devices

Complex dynamic systems

▶ DevOps

Require skilled personnel

Automation

Decision support

Biggest challenge: test, validation and evaluation
